ORG: none TITLE: Investigation of the cation distribution in barium hexaferrites SOURCE: Fizika tverdogo tela, v. 8, no. 1, 1966, 269-272 TOPIC TAGS: barrium compound, ferrite, magnetic moment, crystal symmetry, cation, x ray analysis, saturation magnetization ABSTRACT: The investigated substance $Ba_2Me_2^{2+}Fe_{12}^{3+}O_{22}$ (Me²⁺ stands for Co, Ni, Zn, Cu, Mg, and other metals) has exhibited in various experiments a magnetic moment which differs appreciably from those calculated theoretically by various authors under the assumption that the Me²⁺ ions are located in the spinel blocks of the ferrite structure (E. W. Gorter, Proc. IEE, 104B, Suppl. No. 5, 255, 1957). It is shown, however, that the calculated values and the experimental values

L 21221-66

ACC NR: AP6003811

of the magnetic moment are in better agreement if it is assumed that Gorter's hypothesis is in error and that the Me²⁺ and Fe³⁺ are statistically distributed over the S and T blocks in both tetrahedral and octahedral positions. The cation distribution in the barium hexaferrite, obtained from the measurements of the specific saturation magnetization by the Weis method (P. Weis, Arch. sci. phys. nat. v. 29, 175, 1910) is then compared with the cation distribution obtained by x-ray structure analysis and the two are shown to be in agreement within the limits of experimental accuracy. The formulas for the cation distributions are tabulated for these ferrites with Mg, Zn, Co, Cu, Mn, and Ni. The dependence of the results on the quenching and cooling of the ferrite is briefly discussed. The data show in addition that in hexaferrites, as in spinels, the Ni²⁺ and Co²⁺ have an affinity to octahedra, while the ions Zn²⁺ and Mn²⁺ to tetahedra. Orig. art. has: 2 formulas and 2 tables.

Prague, Activitas Mervosa Superior, Vol 5, No 2, May 63; FF 192-193.

Abstract: Studies in 17 men, mostly schizophrenics: determine ATP and ADP blood levels, give 100 mg. chlorpromazin. and retest 1, 2,, 4, 12, and 32 minutes later. Generally the levels increased when the patient was in a phase of improvement, decreased with a trend toward deterioration, changes being particularly striking during the first few minutes after chlorpromazine (i.v.) Two graphs.

TITE: Influence of an oxygen medium upon the survival of leucocytes in vitro in psychoses of the schizophrenic and manic-depressive group

SOURCE: Ceskoslovenska psychiatrie, no. 6, 1965, 402-407

TOPIC TAGS: psychoneurotic disorder, blood

ABSTRACT: Morphological changes of leucocytes in schizophrenic patients are discussed. An 8 hour period was used as the basic period for the aging of the leucocytes; in this time span pycnosis of the cells is completed. The ratio of pycnotic cells in oxidized blood to that in unoxidized blood was determined; there is a great discrepancy in these ratios between schizophrenic patients and healthy individuals. The leucocytes of the diseased patients are not capable of utilizing the oxygen supplied to them. The authors thank E. Yeckove for taking blood samples. Orig. art. has: 1 figure and 2 tables. TITLE: Balloon measurement of time variations of primary cosmic rays

PERIODICAL: Referativnyy zhurnal. Geofizika, no. 4, 1961, 15, abstract 4 G 88. (Tr. Mezhdunar. konferentsii po kosmich. lucham, 1959, v. 4, Moscow, AN SSSR, 1960, 78 - 84)

TEXT: Variations in cosmic ray intensity near the earth's surface are compared with measurement data obtained by balloons. Analysis of these data yielded values for the intensity of primary particles and for radiation flux at different atmospheric depths as a function of the intensity of the neutron component at the earth's surface. On the basis of these results and the latitude effects of the different components, the authors derived a correlation connecting the variations of primary (P), neutron (N), and hard (M) components:

$$\frac{(P - P_0) P_0 equ}{P_0^2} = \frac{(N - N_0)N_0 equ}{N_0^2} = \frac{(M - M_0)M_0 equ}{M_0^2} = F (t).$$

Balloon measurement of time variations of....

S/169/61/000/004/003/026 A005/A130

Here, P_0 , M_0 , N_0 are fixed quantities, and the index "equ." relates to data for the equator. Analysis of the above expression leads to the conclusion that cosmic ray variations are a consequence of a variation in energy of primary particles in the electric field.

N.K.

TITLE:

Preparation of pure isoprene

PERIODICAL: Chemický průmysl, no.2, 1962, 66-69

A two-stage process for isoprene is investigated involving: 1) reaction of paraformaldehyde with isobutylene to form 4,4-dimethyl-dioxane (1,3) (II); 2) pyrolysis of (II) over a suitable catalyst to produce isoprene (I). The process is known to produce isoprene contaminated with 1 to 4% of pentenes, which it is very difficult to separate and the aim of this paper is to find optimum conditions for the preparation of pure (I). Stage 1. Reaction of paraformaldehyde with isobutylene is The effect of varying carried out in presence of H2SO4 at 80°C. Optimum quantities are the concentration of H2SO4 was studied. Increased quantities produced tarry $1 \text{ g H}_2\text{SO}_4$ per 1 mole CH_2^-O . Heating for 10 min at 80°C produced 70% conversion. by-products. Prolonged heating increased the yield only insignificantly. Reaction is strongly exothermic and difficult to control. Difficulties in maintaining exact reaction conditions were first Card 1/3

Z/009/62/000/002/002/002 E112/E453

Preparation of pure isoprene

They were due to encountered in semitechnical experiments. varying moisture content of paraformaldehyde, which caused a variation in the concentration of H₂SO₄. Difficulties were then easily overcome by introducing necessary corrections for the H₂SO₄ concentration. Effects of H₂SO₄-concentration on rate of reaction and effects of temperature and reaction time on the conversion of isobutylene to (II) are summarized in the form of graphs. Stage 2. Pyrolysis of (II) into (I) was studied with three catalysts: K-1-75% Al₂O₃ + 25% SiO₂, activated for 8 hours at 550°C; K-2-38% H₃PO₄ on aluminosilicate, activated for 8 hours at 400°C; K-3 - mixture of calcium phosphates, activated for 8 hours at 400°C. Best results were obtained with K-2, effecting at 200°C a 79% conversion of (II) into (I) with a yield of 90 mole %. Disadvantages are that during reaction and regeneration of K-2, phosphoric acids are gradually washed out. Catalyst K-3 was, therefore, selected for bulk experiments. Effects of temperature on the efficiency of the catalysts are summarized in Table II, showing conversion of (II) into (I) in mole % and isoprene contents in distillation condensates. Card 2/5

Preparation of pure isoprene

effects of temperature on conversion and on the ratio isoprene: pentenes were investigated. Since separation of isoprene from the pentenes by fractional distillation was found difficult, the authors set out to produce a raw isoprene with low pentene contents even at the cost of lower conversion figures. achieved with K-3 at 285 to 290°C. Results were as follows: conversion of (II) into (I), in mole %, 34 to 37%; yields of isoprene, 85 to 80%; ratio of isoprene:pentenes, 100:0.2 and 100:0.5 respectively. The material was now considered of sufficient purity to be used for polymerizations without further rectification. A chromatogram is shown (Fig.3) and its analysis after one and two rectifications is tabulated (Table V). concluded that the described method does not require complex plant equipment and produces isoprene of low pentene contents. Compared to other procedures, the refining of the crude materials proved simple. Semitechnical yields were 80 to 85% theory, based on 4,4-dimethyldioxane (1,3). There are 3 figures and 5 tables.
